Chemical Properties of Soil. Chemical properties of soil are discussed in this part. Acidity of Soil (pH) From an engineering as well as an agricultural point of view, determination of the pH of the soil mass is essential. For healthy plants to grow, the acidic and basic nature of soil must be known.

An Introduction to Engineering Properties of Soil and Rock

The development of soil and rock properties for geotechnical design purposes begins with developing/defining the geologic strata present at the site in question. Therefore, the focus of geotechnical design

influences many of the physical, chemical and biological properties of soils. Some of the properties influenced by organic matter include soil structure, soil compressibility and shear strength. In addition, it also affects the water holding capacity, nutrient contributions, biological activity, and water and air infiltration rates.

If as little as 10 percent of the particles in sand and gravel are smaller than the No.200 sieve size, the soil can be virtually impervious, especially when the coarse grains are well graded.
