Either $A = 0$, or else $e^{ikL} = 1$, in which case $kL = 2n\pi$ ($n = 0, \pm 1, \pm 2, \dots$). But if $A = 0$, then $Be^{-ikL} = B$, leading to the same conclusion. So for every positive n there are two solutions: $\psi_{n+}(x) = Ae^{i(2n\pi x/L)}$ and $\psi_{n-}(x) = Be^{-i(2n\pi x/L)}$ ($n = 0$ is ok too, but in that case there is just one solution).

Quantum mechanics is the science of the very small. It explains the behavior of matter and its interactions with energy on the scale of atomic and subatomic particles. By contrast, classical physics explains matter and energy only on a scale familiar to human experience, including the behavior of astronomical bodies such as the Moon. Classical physics is still used in much of modern science and ...
