Lubricants And Additives For Polymer

Lubricants as additives for polymers assist the movement of one object passing another object. Their primary role is to reduce friction, minimize wear and prevent overheating of parts. While wear and heat cannot be completely eliminated, reducing them to negligible or acceptable levels is must to maintain performance in your application!

Lubricants - Polymer Additives

Quality Additives for Performance LUBRICANTS Polymers are made of long chain molecules of varying sizes and distributions. These polymers tend to be: §Relatively viscous above their melt temperature §“Sticky” above their melt temperature Lubricants serve to decrease the frictional forces found between : §Polymer : Polymer §Polymer : Metal

Lubricants and Additives for Polymer Compounds

Fluoroguard™ polymer additives are based on a fluorinated synthetic oil and available in three distinct formulations that are colorless, odorless, and chemically inert. By acting as an internal lubricant that migrates to the polymer's surface, they enhance flow properties and process throughput while improving the finished product's wear and abrasion resistance.

Additives like graphite and molybdenum disulfide can weaken the plastic and create problems with a lubricant that comes in contact with the plastic. Metal part lubricants containing EP additives, corrosion protector, and metal deactivator additives are not recommended for use with plastics.

How to Choose Lubricants for Plastics - 3D Insider

Viscosity index improvers are very large polymer additives that partially prevent the oil from thinning out (losing viscosity) as the temperature increases. These additives are used extensively when blending multi-grade engine oils such as SAE 5W-30 or SAE 15W-40.

Lubricant Additives - A Practical Guide

Polymers and oligomers are an important area of research for the oil industry, and many uses for them have been discovered over the years. One important application for polymers is in crankcase lubricants, in which various specialty polymers and copolymers are used as viscosity modifiers, dispersants, and pour-point depressants. These polymers give an oil all-season properties and are the most effective additives in producing multigrade oils.

The acid amides are used for polypropylene (PP) and polyethylene (PE), while the alkyleneamides are used for polyvinyl chloride (PVC), polystyrene (PS), and acrylonitrile butadiene styrene (ABS). Metallic Soaps: Ca, Zn, Mg, and Pb salts of Stearic Acid These are used not only as lubricants but also as stabilizers for PVC.

Introduction of Polymer additives | Chemical Products ADEKA

Additives The "wetting" capabilities of a synthetic wax based lubricant are of considerable assistance in achieving an even dispersion of pigments, fillers and reinforcing agents in the thermoplastic polymer. By becoming a mobile liquid at an early stage in the process, the lubricant helps to "carry" the additives into the polymer matrix.
