The facile, high-yielding, yet general synthesis of electrophilic chloroacetone equivalents 11a–f is described. The enol ethers are assembled in three steps starting with trichloride 29 in overall yields of 57–93%. Nucleophilic displacement of the chloromethyl chlorine with a range of organometallic reagents generates dichlorides 30 in yields of 58–99%, which can be dehydrohalogenated ...

A conceptually distinct approach relies on the direct transfer of the formyl unit to an organometallic reagent such as organomagnesium or organolithium compounds. This tactic evidently requires the design of convenient precursors which do not suffer common side reactions for these reactive species such as over addition or reduction [11a-f].

A revised modular approach to various synthetic (-)-trans- Δ^8 -THC derivatives through late-stage Suzuki-Miyaura cross-coupling reactions is disclosed. Ten derivatives were synthesized allowing both sp² - and sp³ -hybridized cross-coupling partners with minimal β -hydride elimination. Importantly, we demonstrate that a para-bromo-substituted THC scaffold for Suzuki ...

A new, short, and efficient approach toward tricyclic alkaloids, involving the double cycloisomerization–reduction of bis-alkynylpyrimidines 3a–m, has been developed. The requisite bis-alkynylpyrimidines 3a–m were readily prepared via regioselective sequential Sonogashira coupling reactions of dibromopyrimidines 1. Bis-alkynylpyrimidines 3a–m were converted into the 5–6–5 tricyclic ...

Introduction. The indole alkaloid psilocybin (1, Scheme 1) is the principal natural product of hallucinogenic Psilocybe mushrooms. 1 Pharmacologically, it represents the stable prodrug of the actual active, yet unstable 4-dephosphorylated analogue psilocin (2), which targets mainly the human 5-HT 2A -receptor as a partial agonist. 2 Modern scientific therapeutics rediscovered 1 as a ...
